

INSTRUCTION

In the file [CASME2-coding-updated.xlsx](#):

"[Subject](#)": the No. of the participants,

"[Filename](#)": the names of video clips,

"[OnsetFrame](#)": the first frame for the micro-expression,

"[ApexFrame](#)": the apex frame for the micro-expression,

"[OffsetFrame](#)": the last frame of the micro-expression,

"[AU](#)": action units (see FACS).

"[Emotion](#)": the estimated emotion. The emotion labeling is a little different from CASME: in CASME, those with uncertain emotions were labeled as *tense*, in CASME2, they were labeled as others.

* For automatic recognition, you may just used the selected images in [CASME2_RAW_selected.zip](#) or the [Cropped.zip](#), where the image sequences begin with [OnsetFrame](#) and end with [OffsetFrame](#).

* When importing the filenames to Matlab, the filenames may be arranged as 'img1', 'img10', 'img11', ... 'img2', 'img21'. This is not the original sequence, please be aware of this problem.

THE FILELIST:

- CASME2-RAW.zip

RAW video clips and images without any preprocessing.

- CASME2_compressed.zip

The video clips are recorded at 200fps. For psychological research (usually presenting a clip to the participant), the compressed clips is

clear enough but with much less size.

- CASME2_RAW_selected.zip

Image sequence of the micro-expressions. In each subfolder, the first image is the [OnsetFrame](#), the last is the [OffsetFrame](#).

- Cropped.zip (based on the selected images)

Images registered based on a template face. Since the movement of micro-expression is very tiny, alignment may "bury" the tiny changes. You may try to re-preprocess these selected images.
